(54) **Audio/video from internet direct to compact disc through web browser**

(57) A system and method for automatically creating user-customized compact discs (CDs) (112) containing multimedia tracks available over the Internet is presented. CD creation software (106) resident on the user's computer (102) or that is downloaded (304) from a web site that contains managed multimedia content is launched (308) from an Internet browser (104). The CD creation software (106) allows the user to select desired

tracks (204) from a list of multimedia tracks (202) available from the managed web site. The selected tracks (204) are downloaded (318) from the web site and recorded onto a portable CD (112) at the user's request (212), or automatically per a user-specified schedule (214).

## EP 1 003 115 A2

**Description**Field of the Invention

[0001] The present invention pertains generally to Internet services, and more particularly, to a system and method for allowing a user to select and download audio/visual tracks from the Internet and to record them directly onto a CD via a web browser for later retrieval.

Background of the Invention

[0002] The proliferation of the World Wide Web through the Internet has made available a wealth of information with nearly instantaneous access time. Much of the information available is in multimedia (i.e., audio and/or video) format, including music tracks and news reports. The multimedia content may be completely dynamic, being updated daily, hourly, or even broadcast live.

[0003] It is often convenient to capture a selection of various tracks available over the Internet on a local portable media for later playback. With the availability now of writable compact discs (CDs) and the massive user base of CD players already in use, it would be desirable to provide a system and method for allowing a user to select and download various audio/visual tracks from the Internet and to record them directly onto a CD for, later retrieval.

[0004] Depending on the size and format of the multimedia track, the bandwidth of the user's Internet connection, and the amount of traffic on the Internet at the time of download, the process required in visiting a service site, downloading a requested track, and listening to or watching the downloaded track may be time-consuming and/or inconvenient.

[0005] Accordingly, a need also exists for a system and method for selecting audio/video tracks from Internet multimedia service providers, automatically downloading the selected tracks, and writing the downloaded tracks to a CD for later retrieval by the user. It would also be convenient to provide a method for setting up a profile specifying the tracks and time desired, and having the CD created automatically without user intervention.

Summary of the Invention

[0006] The present invention provides a system and method for allowing users, via an Internet browser, to select various audio/visual tracks from Internet multimedia service providers, and have them downloaded and written to a CD using a CD writer. The CD may then be played at the user's convenience using, depending on the particular media, a CD or DVD drive. The invention allows the user to create a CD containing only the sounds, images, and information desired. In addition, the CD may be scheduled to be created without any user intervention to allow the CD to be available at the user's convenience.

Brief Description of the Drawing

[0007] The invention will be better understood from a reading of the following detailed description taken in conjunction with the drawing in which like reference designators are used to designate like elements, and in which:

FIG. 1 is a block diagram of a system in accordance with the invention;

FIG. 2 is an illustrative embodiment of a user interface in accordance with the invention; and

FIG. 3 is a flowchart of a method of the invention.

Detailed Description

[0008] FIG. 1 is a block diagram of a system 100 in accordance with the invention. In system 100, a computer 102 running a create CD application 106 in accordance with the invention via an Internet browser 104 downloads user selected audio/video tracks from the World Wide Web 120 over an Internet connection 122. The user selects tracks from a list of available services, displayed by a user interface of application 106, in any desired combination and order. Application 106 schedules the selected downloaded tracks for recording to CD 112 in CD writer 110. At the scheduled time, the selected downloaded tracks are written to CD 112 via a communication interface 114. Once the CD 112 is recorded, the user may play back the contents of the CD on any CD drive compatible with the particular medium of CD 112. To initially obtain the create CD application 106, a user navigates, via the user's Internet browser 104, to a web site that allows the user to download the create CD application 106 and downloads the application. When the user launches a CD write operation from browser 104, a user interface is presented that allows the user to select audio/video tracks from multimedia service providers.

## EP 1 003 115 A2

[0009] FIG. 2 is an illustrative embodiment of a user interface 200 displayed within the users Internet browser 104 in accordance with the invention. As shown, user interface 200 includes a list of available services 202 and a list of selected services 204. The list of available services 202 includes a list of audio/video tracks made available by service providers. The list of available services 202 is typically configured by the provider of the user interface 200. Accordingly, the user interface 200 may vary from provider to provider, along with the services available through their user interface 200.

[0010] User interface 200 includes adding means 206 for allowing the user to select tracks from the list of available services 202 and the order in which to record them. In the illustrative embodiment, adding means 206 is implemented with an Active X Control button labeled "Add". The user moves the mouse or cursor over the desired service in the list of available services 202 so that the selected track is highlighted on the user display, and then clicks the "Add" button. The selected track then appears in the list of selected services 204.

[0011] In the illustrative embodiment, user interface 200 includes removal means 208, implemented with an Active X Control button labeled "Remove", that allows the user to remove a selection by moving the mouse or cursor over the desired track in the list of selected services 204 such that the desired track becomes highlighted, and then clicking on "Remove" button. The highlighted track then disappears from the list of selected services 204 and is not included to be recorded when the CD is created. All selected tracks may be removed from the list of selected services 204 via a "Clear All" button 210.

[0012] User interface 200 also includes writing means 212 that causes the tracks listed in the list of selected services 204 to be written to the CD media. In the illustrative embodiment, writing means 212 is implemented as an Active X Control button labeled "Write Disc Now" that launches a write CD write operation. The write CD operation (not shown) handles the communication interface between the user's computer and the CD writer drive.

[0013] Preferably, user interface 200 includes scheduling means 214 to allow the user to schedule the tracks in the list of selected services 204 to be written to CD. In the illustrative embodiment, scheduling means 214 is an Active X Control button labeled "Schedule", which when clicked on, launches a scheduling application.

[0014] One application that the scheduling feature is particularly useful in is as a personal news recorder for making custom news and information discs. In this application, the user selects a number and order of available services desired such as the evening news, stock quotes, and entertainment news, then selects a desired ready time that the disc should be ready for pick-up, and activates the scheduling means 214 by clicking on the "Schedule" button. Scheduling means 214 launches a scheduling operation that schedules the download of the user-selected tracks and the time to launch the write operation for writing the tracks to the CD, such that the CD will be ready at the desired ready time. Thus, the CD is automatically created in the user-customized format without hands-on intervention and is ready for the user at his/her convenience. The user-customized profile (selected services, order, and desired ready time) may be scheduled to create a disc as often as the user desires.

[0015] User interface 200 may include additional features such as the ability to add or configure the list of available services. In the illustrative embodiment, this feature is provided by an Active X Control button 216 labeled "Add New Service", which launches a setup/configuration application when activated. Other features may include help facilities 218, information facilities 220 about the product or company, a link 222 to the provider's home web page, and more.

[0016] The illustrative embodiment of user interface 200 also provides previewing means 224, implemented as Active X Control button labeled "Preview". Previewing means 224 allows the user to highlight a track from the list of available services 202 and then activate the previewing means 224 to listen to or watch the highlighted audio/video track (or a portion of it) before deciding whether or not to add it to the list of selected services 204.

[0017] One application that this feature is particularly useful in is in a music retriever application. For example, a recording company may act as a service provider and supply a list of available audio tracks as the list of available services 202. Using the previewing means 224, the user may listen to a portion of a track in the list of available services 202 before adding it to the list of selected services which will be written to CD. Thus, the user can preview the track before writing it to CD in order to prevent unnecessary writing to the CD of those tracks ultimately not wanted.

[0018] FIG. 3 is a flowchart of the steps taken by a user to perform the method of the invention. Initially, the create CD application must be installed on the users system. This is performed either in a step 302 by navigating to a website that offers the create CD application for download and then downloading and installing the application on the users system in step 304. Alternatively, the application may be provided on an install CD that is provided by the CD drive manufacturer/supplier. In the preferred embodiment, the application is provided in a Microsoft format .CAB file, implemented as an ActiveX control that resides on an HTML web page of a web site. A cabinet is a single file created using Lempel-Ziv compression to hold a number of compressed files, and is used to save space and time during software distribution. During installation of a program, the compressed files in a cabinet are decompressed and copied to an appropriate directory for the user. In operation, the user navigates to the web site where the application is offered, and clicks on an HTML icon to download the create CD application. The cab file is then downloaded to the user's computer where it automatically unzips and decompresses itself and launches the user interface. As an alternative, in a Netscape Navigator environment, the application may be implemented as a plug-in.

## EP 1 003 115 A2

[0019] Once the application is installed on the users system, the user launches the application as part of the local Internet browser in a step 308. This step may be performed automatically when the create CD application is installed, or may be performed manually by the user by clicking on an icon associated with the application on the desktop or within a program. Launching the application brings up the user interface of the application on a page (e.g., user interface 200 of FIG. 2) within the user's browser. Once the user interface is displayed, the user may then add new services in step 312. Adding new services is performed by activating a configuration application which registers the URL of an authorized multimedia service provider with the application. The authorization of an multimedia service provider is typically obtained via an authorization code provided by prior agreement between the multimedia service provider and application vendor.

[0020] The user selects services from the list of available services (or deselects services from the list of selected services) in step 310. The content of the available services is provided by the server side of the multimedia track providers' web site. In the illustrative embodiment, the format of the multimedia services content is a RealAudio<sup>®</sup> ".ra" file captured to a ".WAV" file. Service providers that wish to make their services available via the create CD application may be required to support a particular services content file format specified by the create CD application developer, or alternatively, the create CD application may include a file format converter that converts a number of file formats to the particular format that is written to the CD. Thus, for example, when a .ra audio/video track is downloaded from a service provider, the application may be implemented to convert the .ra track to a .wav file before writing the track to the CD. One embodiment may include a virtual sound card configured to convert audio/video tracks into a format that can be written to a CD.

[0021] The user then directs the application to write the disk immediately in step 314, or sets up the scheduler to schedule the write to the disk in step 316. In one implementation, the source (URL), time and/or size, data type, and other conversion or calculation parameters associated with a selected service are registered in a registration file which the write application reads when it is launched. If the disk is to be written immediately via step 314, the registration file is passed as a parameter to the write application. The write application downloads each selected track designated in the registration file and then writes each downloaded track to the CD 112 in the CD writer 110 via the communication interface 114. In the preferred embodiment, communication interface 114 is a SCSI interface communicating via calls to Adaptec Easy-CD Toolkit (XCD) library, version 2.0, manufactured by Adaptec, Inc. The programmer's references are detailed in Adaptec Easy-CD Toolkit (XCD) 2.0, Part #: 100023 - Manual revision: (G rev/19 Jan. 96), 2/20/97.

[0022] If the write to the CD is to be scheduled in step 316 for a later time, the user launches the scheduling application. Preferably, the scheduling application prompts the user for a desired completion time and is passed the registration file as a parameter. Then, scheduling application calculates how long the download and write to the CD will take based on the size, data type and sampling rates, modem speed, average network load for the requested time of day, and other system parameters or parameters contained the registration file to determine a time to launch the write application. Scheduling application then schedules the write application for that time. When the scheduled time arrives, the write application is launched, which downloads the selected tracks and writes them out to the CD writer drive in step 318.

[0023] Appendix A is an illustrative embodiment of an example user interface control file for a personal news recorder application of the create CD application of the invention. The user interface is implemented in Microsoft<sup>®</sup>'s Visual Basic. Section 1 of Appendix A defines each of the user interface boxes and command buttons, which include the main window of the personal news recorder, the operation status list, the preview timer, the preview command button, the help text box, the visit vendor picture box, the selected services list box, the available services list box, the write disc now command button, the schedule command button, the add new service command button, the clear all command button, the remove selected service command button, the add selected service command button, the help timer, the about this program command button, the help command button, the "available services" and "selected services" labels, and the borders and outlines. Section 2 of Appendix A contains the constant definitions and variable and external API declarations. For example, external API's for playing sound "WINMM.DLL" and for writing a wave file to CD "WRITE WAV.DLL" are declared in this section. Section 3 of Appendix A includes pseudocode for the subroutines associated with the user interface. These include routines for disabling all command buttons, enabling all command buttons, recording a track, responding to a click on the "About this Program" command button, adding a track to the selected services list in response to a click on the "Add" command button, responding to click on the "Add New Service" command button, clearing the entire selected services list in response to a click on the "Clear" command button, responding to a click on the "Help" command button, responding to a click on the "Preview" command button, responding to a click on the "Remove" command button, responding to a click on the "Schedule" command button, and writing to the CD in response to a click on the "Write CD Now" command button. Each of the subroutines may call external routines to accomplish its action. For example, the routine WriteDiscNow\_Click() calls external API writewav(), a C implementation of the code used to write to the CD writer.

[0024] Appendix B is an illustrative embodiment of the C implementation for API writewav() which handles the writing out of tracks to the CD writer drive. Writewav() links in the Adaptec Easy-CD Toolkit (XCD) library, version 2.0, man-

**EP 1 003 115 A2**

ufactured by Adaptec, Inc., that allows it to communicate with the CD writer via a SCSI interface.

[0025] The implementation is an instance of the user interface window defined in Appendix A. The instance is created via an ActiveX control and displayed within the Internet browser. The ActiveX control handles all of the processing of user input mouse clicks through the procedures defined in the Visual Basic code in Appendix A.

[0026] Although the invention has been described in terms of the illustrative embodiments, it will be appreciated by those skilled in the art that various changes and modifications may be made to the illustrative embodiments without departing from the spirit or scope of the invention. It is intended that the scope of the invention not be limited in any way to the illustrative embodiment shown and described but that the invention be limited only by the claims appended hereto.

## APPENDIX B

```

#include <windows.h>

5      #include "xcd.h"

BOOL WINAPI DllMain (HANDLE hModule, DWORD fdwReason, LPVOID lpReserved)
{
    switch (fdwReason)
    {
10      case DLL_PROCESS_ATTACH:
        /* Code from LibMain inserted here. Return TRUE to keep the
           DLL loaded or return FALSE to fail loading the DLL.

           You may have to modify the code in your original LibMain to
           account for the fact that it may be called more than once.
           You will get one DLL_PROCESS_ATTACH for each process that
           loads the DLL. This is different from LibMain which gets
           called only once when the DLL is loaded. The only time this
           is critical is when you are using shared data sections.
           If you are using shared data sections for statically
           allocated data, you will need to be careful to initialize it
           only once. Check your code carefully.

           Certain one-time initializations may now need to be done for
           each process that attaches. You may also not need code from
           your original LibMain because the operating system may now
           be doing it for you.
25      */

## Claims

- 45 1. A method for automatically downloading from the Internet and recording user-selected audio and/or visual tracks (204) onto a portable CD (112) via a web browser (104), said method comprising the steps of:

determining a pre-selected multimedia track, said pre-selected multimedia track comprising a multi-media track available from a web site;  
50 downloading (318) said pre-selected multimedia track from said web site;  
recording (318) said downloaded multimedia track onto said portable CD.

2. A method in accordance with claim 1, comprising:

55 selecting (310) said pre-selected multimedia track from a plurality of multimedia tracks (202) available over said Internet.

3. A method in accordance with claim 1 or 2, comprising:

**EP 1 003 115 A2**

navigating (302) to said web site using said web browser (104);  
downloading (304) a compact disc (CD) creation application (106) from said web site, said CD creation application (106) comprising means (206) for selecting said pre-selected multimedia track (204) from a plurality of multimedia tracks (202) available over said Internet; and  
5 launching (308) said CD creation application (106) from said web browser (104).

4. A method in accordance with claim 1, 2 or 3, comprising:

scheduling (316) said downloading step and said recording step to complete said recording step by a pre-specified time.

5. A method in accordance with claim 1, 2 or 3, comprising:

scheduling (316) said downloading step and said recording step to occur at a pre-specified time.

6. A method in accordance with claim 1, 2 or 3, comprising:

scheduling (316) said downloading step to occur at a pre-specified time.

7. A method in accordance with claim 1, 2 or 3, comprising:

scheduling (316) said recording step to occur at a pre-specified time.

8. A user interface for automatically downloading from the Internet and recording user-selected audio/visual tracks onto a portable CD via a web browser, comprising:

a list (202) of available multimedia tracks available for download from the Internet;  
selection means (206) for selecting one of said available multimedia tracks from said list;  
recording means (212, 214) for causing said selected one of said available multimedia tracks to be downloaded from the Internet and recorded onto a compact disc (CD) (112).

9. A user interface in accordance with claim 8, wherein:

said recording means comprises scheduling means (214) for scheduling said download of said selected one of said available multimedia tracks from the Internet and said recording onto said CD (112) to occur at a user-selectable time.

10. A user interface in accordance with claim 8, wherein:

said recording means comprises scheduling means (214) for scheduling said download of said selected one of said available multimedia tracks from the Internet and said recording onto said CD (112) to occur by a user-selectable time.
